

Touchless Authentications

Integration-less Proof of Technology

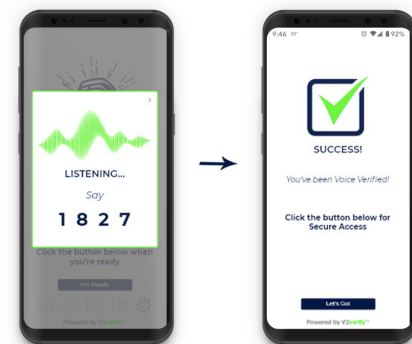

TOUCHLESS AUTHENTICATION

1. The customer opens the V2verify mobile application, answers a few random questions, and is authenticated using only their voice.
2. Now verified, the customer can scan the QR code with the V2verify mobile application.
3. The customer's authentication is sent to the bank teller terminal located inside the branch noting the authentication and which lane the customer is in.
4. The teller presses OK to accept the authentication, a record is created for an audit trail, and the screen is cleared for the next customer.
5. The teller can now assist the customer with any services required.

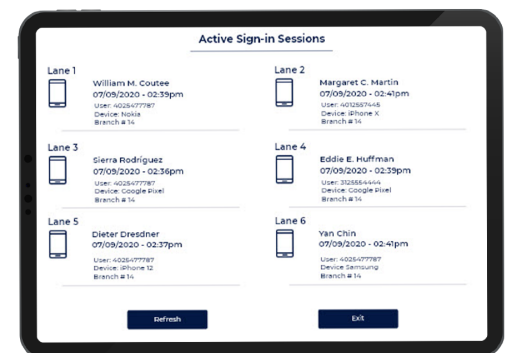

Touchless Authentication Process Flow

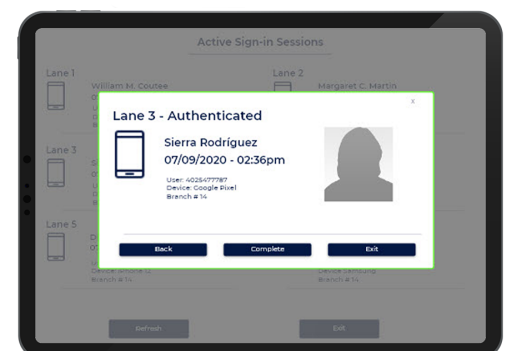

The Customer starts up the V2application and Voice Authenticates

The Customer then scans the QRCode in their drive-up lane and sends the banking capsule

Inside the Bank, the Teller's portal notes the authenticated customer.

All data easily accessed through the V2console
